Automatic Hand Sanitiser stations

An automatic hand sanitiser dispenser is a convenient and professional way of maintaining good workplace hygiene among staff and visitors alike. The clever motion sensor ensures that the correct amount of hand sanitiser is dispensed when required; the touchless design is the most hygienic option available. It is optionally available with 500ml hand sanitiser gel.

This touch free hand sanitizer dispenser is supplied with either a blue and white, or grey and white print featuring the message 'Automatic Hand Sanitiser'. It also has a pictorial representation of hand cleaning, making it ideal for locations with international visitors.

P08

P09

P10

Wall mounted Automatic Hand Sanitiser

The Wall Mounted Hand Sanitiser Station features an automatic, no touch dispenser that allows you to clean your hands in the most hygienic manner. The dispenser is mounted onto an acrylic sign which comes with four 20mm satin anodised standoffs for a professional appearance.

The sign measures W240xH670mm. The dispenser unit is made from ABS plastic. This dispenser also comes with a useful drip tray, which catches any sanitiser residue.

Illuminated COVID Signage

Available in illuminated and non illuminated options, these signs consist of a lightweight aluminium box – usually powder coated and a flexible PVC 'skin' or face that is tensioned around the edges of the box to give a seamless finish.

The PVC banner 'skin' is specifically printed for backlit applications to allow for the light to illuminate the banner graphic from edge to edge.

Why LED lighting?

LED lighting - A light-emitting diode (LED) is a solid-state semiconductor device that converts electrical energy directly into light. The efficiency of a light source is simply the fraction of electrical energy converted to light (i.e., watts of visible light produced for each watt of electrical power with no concern about the wavelength where the energy is being radiated).

LEDs have many advantages over incandescent light sources including lower energy consumption, longer lifetime, improved physical robustness, smaller size, and faster switching.

LED lights consume less energy than conventional halogen lighting. They last much longer and are far easier to maintain.

Automated Contactless Temperature Checking

Using Melexis thermal imaging technology, in conjunction with cooling fans to maximise accuracy, this complete solution can read a user's temperature and display the results in 1.8 seconds, even if they are wearing a mask. The automated nature of this system not only efficiently reduces manual labour, but also means it is completely contactless, which is of paramount importance in today's world.

- 8 Inch - FR8A Panel
- Resolution: 800x1280
- Display Area: (mm) 107.62x172.18

Mounting Options:

As standard, this solution comes with an adjustable desk mounted pole. Optional mounting options include: a flush fit or adjustable wall mount, a desk stand, or a floor stand. All additional stand options have a modern integrated blue LED light.

Covid Site Surveys & Audits

We offer full signage surveys and audits for workplaces, government, public and private sector organisations responsible for high-traffic spaces and other commercial centres, to establish a safe environment for businesses and visitors, in order to reduce the spread of COVID-19.

The work scope can include:

A site visit to assess the current social distance and safety measures and identify gaps in these which put employees and visitors at risk of COVID-19 infection.

Develop a signage risk assessment and holistic safety plan with aims to:

- Increase the level of safety measures in line with government guidance and social distancing policies, to create a positive change of behaviour.
Improve pedestrian flows and reduce congestion points such as lobbies and exit / entrance areas.
- Propose adjustments to release space and increase public and employee safety.
- Reduce message confusion (where existing signage is poorly placed or out of date).
- Recommend changes to improve safety with a consistent approach across individual and public spaces.
- Suggest additional measures which could be implemented if restrictions tighten due to further waves.

Recommend next steps for the implementation of the safety measures, as well as the associated evaluation and monitoring plans.

Create a quality report to include all the above findings, including photos to show the problem areas, maps to mark out the location and diagrams to show how the measure can be implemented to address the issues.

The site survey will identify:

Hazards/health & safety issues, Sign location, Product suitability, Correct signage sizes, Legibility requirements, Navigational issues, Disability requirements and Installation requirements (including access machinery)
